

Limitations

- **CPM is derived, not disclosed.** No source in this project directly publishes a CPM figure for either channel; it's computed as $CPC \times CTR\% \times 1000$ and should be read as an internally-consistent derivation, not an independently-benchmarked number.
- **Two inputs are illustrative assumptions, not sourced figures:** the INR 75,000 fixed campaign cost and the 30% incrementality haircut. Replace both with real figures (a rate card, or a real holdout-test result) before using this for an actual campaign decision.
- **Benchmarks are national/global averages,** not specific to Tata CLiQ, any single brand, or any single product category - real CTR/CVR vary hugely by category and creative quality.
- **Shopping CVR (1.91%) is a global figure;** no India-specific Shopping conversion-rate benchmark was found this session.
- **The funnel is linear** (no diminishing returns as spend scales, no auction-price escalation at higher spend) - real campaigns see CPMs rise with scale; this model does not capture that.
- **No number from this project should reach a resume until this file has been re-read and is still accurate.**
